

CLI vs GUI

CLI (Command Line Interface) is a text-based way to interact with a computer. CLI can be rather intimidating to use, but it can be much faster for repetitive tasks. CLI is accessed differently based on the OS of the computer. For example, Windows 11 allows you to access the CLI via the terminal, which can be reached by searching “cmd” in the windows search bar. GUI (Graphical User Interface), however, is specifically designed to be easy to use. GUIs add visual elements that represent the information the CLI would present, such as the folders in Windows File Explorer. GUIs are present everywhere, from desktops to smartphones. While they are easy to use, GUIs require direct user input, which makes automating repetitive tasks harder.
